

Credentialing POC — Where to Start

Thin Application lifecycle before integrations

Document type: POC start guide (PDF-ready)
Product: Credentialing / recredentialing proof of concept
Date: 12 August 2026
Pairs with: TriWest friction map · App/Supabase plan · Salesforce POC configuration plan

1. Start here

Build a **thin Application lifecycle** first — not Aperture, Visual Cactus, or a committee portal.

Prove one vertical slice:

Provider → Credentialing Application (New / Recred) → Credentials → Checklist

Then four automations (in order):

- 1. **Intake Screen Flow** — Practitioner vs Facility, New vs Recred, Path; completeness gate
- 2. **Checklist / status gate** — cannot reach In Review while incomplete (Path on Application)
- 3. **3-attempt outreach** — scheduled paths → Spec Tasks → escalate to TL
- 4. **Recred-at-~120 days** — nightly job creates Recred Applications

UI: Physician 360 = **standard Lightning record page + related lists** (no custom LWCs).
Data: Load synthetic practitioners/facilities from the workbook via Supabase (or CSV) into SF for demo.

Pitch: *Salesforce becomes the intake + status + recred clock; Cactus/Aperture stay verification engines until the workflow layer is proven.*

2. Why this slice

Reason	Detail
Highest pain, low dependency	TriWest map's worst friction is intake typing and incomplete apps — solvable without VC/Aperture
Recred is a clear before/after	Mgrs already pull recred months out; a scheduled create-Recred job demos value fast
Demoable to Cred Specs	Specs live in chase loops and status updates; outreach + 360 shows daily-work relief

3. Minimum data model

Object	Must-have
Provider__c (or equivalent)	NPI, Practitioner Facility, org, cred dates/status, External Id
Credentialing_Application__c	New Recred; Path (CAQH / In_House / Facility); Status; due dates
Provider_Credential__c	Type, number, issuer, issued/expires, status
Checklist_Item__c	Template-driven required docs/data; complete? blocks advance

Conventions:

- Application.Type = New | Recred
- Application.Path = CAQH | In_House | Facility (Delegated later)
- Status picklist advanced by Flow / Path — not free-form spreadsheet churn

4. Four Flows (build order)

#	Flow	Proves	Why first
1	Intake Screen Flow	Classify subject; New vs Recred; checklist before queue	Fixes #1 TriWest pain
2	Checklist / status gate	Draft → Incomplete → In Review → ... → Approved/Denied	Replaces VC checkbox churn for the demo
3	Outreach cadence	Attempt 1/2/3; escalate to TL	Highest demo wow per build hour
4	Recred scheduler	Auto-create Recred apps ~120 days before expiry	No Aperture/VC needed to prove the pattern

Optional stretch: one standard **Approval Process** (Cat A–style).

5. In POC scope vs out

Do

- Manual create / Data Loader (or Supabase CSV) for Providers and Credentials
- Checklist templates: Practitioner vs Facility (new vs recred)
- List views: Incomplete chase, recred due, Pending Committee
- Spec + TL queues; cert mail as a **manual Task** only
- Standard Lightning Physician 360 (Highlight, Detail, Related Lists, Activities)

Defer / substitute

Defer	POC substitute
Aperture file exchange	Path label only / ignore
Visual Cactus as SoR	SF + Supabase hold demo data
Cat B / Med Director workspace	Out of POC
2–3K delegated bulk load	Out of POC
Certified mail send	Human Task — never auto-send
CAQH live API	Fields preloaded from dataset

6. Success criteria

Scenario	Pass condition
Happy path	New Practitioner app: complete checklist → In Review → Approved
Incomplete gate	Facility (or practitioner) app with open checklist items cannot reach In Review

Chase	Incomplete app creates Spec Tasks on cadence; attempt 3 → TL
Recred	Expiring credential/provider auto-spawns Recred Application
360	Spec opens Provider record page and sees credentials, apps, tasks — no custom LWC

7. After the POC lands

Next	Only after core path is trusted
Approvals	Cat A daily batch; later Cat B
Integrations	Aperture / CAQH / VC / AP one at a time
Experience Cloud	Committee portal (email size-limit pain)
