

Credentialing Proof of Concept

Development Start Plan

Document type: Implementation plan (PDF-ready)
Product: Credentialing / Recredentialing POC
Stack: Next.js · Supabase (Postgres)
Data source: `Provider_Credentialing_Dataset.xlsx` (extended with synthetic facilities)
Date: 12 August 2026

1. Purpose

Prove a vertical slice of credentialing workflow automation:

- 1. Intake classification (practitioner vs facility)
- 2. Completeness checklist gate
- 3. Status orchestration
- 4. Recredentialing / expiration queue

Seed the system from **one** synthetic workbook. Practitioners already exist in the file; **facilities are added to the same spreadsheet** (not a separate JSON/CSV fixture).

Live integrations (Aperture, Visual Cactus, CAQH APIs), committee voting UIs, and Salesforce metadata are out of scope for this POC.

2. Locked decisions

Decision	Choice
Seed format	Single Excel workbook only
Facility data	New sheets inside the same workbook
Subject model	One <code>providers</code> table with <code>subject_type = practitioner facility</code>
Expiration window	90 days ("EXPIRING SOON"), matching workbook logic
Recred cycle	NCQA-style 3 years via cred effective → expiration dates
Auth (POC)	Stubbed; status changes via API
Workflow overlays	Applications, checklists, outreach derived after import (not Excel columns)

3. Workstream checklist

#	Workstream	Deliverable
0	Extend workbook	Facilities + facility child sheets (~8 facilities)
1	Vendor dataset	Copy workbook to <code>data/fixtures/Provider_Credentialing_Dataset.xlsx</code>
2	Schema	Supabase migration for orgs, providers, credentials, sanctions, POC overlays

3	Import	scripts/import-credentialing-xlsx.ts + npm run seed:credentialing
4	Types	Align src/types with imported fields
5	App wiring	Supabase clients, env, API routes, list/detail UI
6	POC behaviors	Intake, checklist gate, outreach, recred/expiration
7	Docs	Update docs/architecture.md with ER and success criteria

4. Phase 0 — Extend the workbook

4.1 Keep existing sheets

Sheet	Role
README	Update for facilities, join keys, flag logic
Providers (42 rows)	Practitioners (unchanged)
Licenses	Practitioner state licenses
Board_Certifications	Practitioner board certs
DEA_Registrations	Practitioner DEA (subset)
Malpractice_Insurance	Practitioner malpractice
Sanctions_Exclusions_Monitoring	Practitioner monitoring

4.2 Add facility sheets

New sheet	Approx. rows	Purpose
Facilities	~8	Master facility subjects (parallel to Providers)
Facility_Licenses	~8	State facility / operating licenses
Facility_Accreditations	~8	AAAH / Joint Commission / CARF / etc.
Facility_Malpractice	~8	Entity liability / malpractice
Facility_Sanctions_Monitoring	~8	Exclusion / sanctions-style checks
Facility_CLIA (optional)	~2–3	Lab facilities only

4.3 Facilities sheet columns

Align to Providers where possible:

- Facility ID (e.g. FAC-2001) — join key for child sheets
- Facility Name
- Facility Type — ASC | Imaging | Clinic | SNF | Urgent Care | Lab | PT
- NPI (Type 2 where applicable)
- Group/TIN Entity + TIN — prefer existing five groups; allow one independent org if needed
- Practice State
- Credentialing Status — Active | Pending Recredentialing | Provisional | Under Committee Review

- Cred. Effective Date / Cred. Expiration Date — 3-year cycle
- Days to Recred. Expiration / Recred. Status Flag — same formulas as Providers (EXPIRED / EXPIRING SOON ≤90 days / ACTIVE)

4.4 Suggested synthetic facilities

Facility ID	Name	Type	Group
FAC-2001	Coastal Ambulatory Surgery Center	ASC	Coastal Medical Group
FAC-2002	Harborview Imaging Center	Imaging	Harborview Multispecialty Group
FAC-2003	Sunrise Behavioral Health Clinic	Clinic	Sunrise Health Partners
FAC-2004	Meridian Skilled Nursing	SNF	Meridian Physician Network
FAC-2005	Vanguard Urgent Care — Midtown	Urgent Care	Vanguard Clinical Associates
FAC-2006–2008	Lab / PT / independent ASC	Mixed	Existing or new TIN

Include mixed credentialing statuses and at least one expired and one expiring-soon license or accreditation. Use real Excel dates so formulas recalculate like the practitioner sheets. Update README to state all facility data is synthetic.

5. Data flow (workbook → database)

1. Read `Provider_Credentialing_Dataset.xlsx` from `data/fixtures/` .
2. Upsert **organizations** from distinct Group/TIN on Providers and Facilities.
3. Upsert **providers** (`PRV-*` practitioners, `FAC-*` facilities).
4. Upsert **credentials** from practitioner and facility child sheets.
5. Upsert **sanctions_checks** from both monitoring sheets.
6. Derive **applications**, **checklist_items**, and **outreach_attempts** for demo scenarios.
7. Application UI and APIs read from Supabase; recompute expiry flags from stored dates (do not trust stale Excel flag columns as source of truth after import).

5.1 Credential kinds

Practitioner: `medical_license`, `board_certification`, `dea`, `malpractice_insurance`

Facility: `facility_license`, `accreditation`, `malpractice_insurance`, `clia` (optional)

6. Phase 1 — Schema and import

6.1 Core tables

Table	Purpose
<code>organizations</code>	Groups from Group/TIN on both master sheets
<code>providers</code>	Practitioners and facilities (<code>subject_type</code>)
<code>credentials</code>	All credential child sheets
<code>sanctions_checks</code>	Both monitoring sheets

6.2 POC overlay tables

Table	Purpose
applications	new recred; path caqh in_house facility delegated
checklist_templates / checklist_items	Separate practitioner vs facility templates
outreach_attempts	Three-attempt chase
documents	Optional metadata stub

6.3 Application status machine

draft → incomplete → in_review → pending_committee → approved | denied | termed | withdrawn

6.4 Import script

- Path: `scripts/import-credentialing-xlsx.ts`
- Command: `npm run seed:credentialing`
- Responsibilities: parse workbook, convert Excel dates to ISO, upsert core tables, seed thin POC overlays

7. Phase 2 — Wire Supabase into the app

1. Install `@supabase/supabase-js` and `@supabase/ssr`.
2. Implement `src/lib/supabase/client.ts` and `server.ts`.
3. Configure `.env.local` from `.env.example`.
4. Replace API stubs under `src/app/api/` with real queries.
5. Render list/detail pages under `src/app/(app)/` with Practitioner / Facility filter; detail shows credentials and sanctions.

8. Phase 3 — Four POC behaviors

#	Behavior	Proof
1	Intake	Choose practitioner vs facility; instantiate matching checklist; block leave-draft if incomplete
2	Status machine	Advance to in_review only when checklist complete
3	Outreach	Record attempts on incomplete apps (include ≥1 facility)
4	Recred / expirations	Queue expired and ≤90-day cases for both subject types; action to create recred application

Also update `docs/architecture.md` with workbook provenance, entity relationships, and success criteria.

9. Out of scope

- Live Aperture, Visual Cactus, or CAQH API integrations
- Cat A / Cat B committee voting UI
- Bulk delegated NetSub loads (thousands of rows)
- Certified mail processing
- Salesforce metadata / org packaging
- Separate facilities JSON or CSV fixture

10. Success criteria

1. Workbook contains Facilities and facility child sheets with approximately eight synthetic facilities.
2. Import loads 42 practitioners, ~8 facilities, organizations from both, and all credential/sanctions rows from the **single** xlsx.
3. UI lists and filters practitioners and facilities.
4. An incomplete facility application cannot move to `in_review` .
5. Expirations view shows expired and expiring-soon cases for both subject types.
6. Happy path works for one practitioner and one facility: complete checklist → `in_review` → approved.

11. Architecture (logical)

Client: Next.js App Router UI

Server: API routes / server actions

Database: Supabase Postgres

Seed: `scripts/import-credentialing-xlsx.ts` ← `data/fixtures/Provider_Credentialing_Dataset.xlsx`

Flow: Workbook → Import script → Supabase ← API ← UI
